High Performance Key Components

## Confirmation of conformity of the products of Klaus Kuhn Edelstahlgießerei GmbH with the European Regulation 1907/2006 - Registration, Evaluation, Authorisation and Restriction of Chemicals (REACH)

Dear customers,

In our centrifugal casting sector, we mainly cast high-alloy stainless steels. Our portfolio mainly comprises tool steels, martensitic, austenitic and duplex alloys through to high-alloy materials based on iron and nickel. These materials are used where the highest demands are placed on corrosion resistance, wear resistance and/or high-temperature resistance. We thus have a large number of application-specific alloys for a wide range of industries and markets.

As a foundry, we use chemical substances as auxiliary and operating materials, which we obtain from external suppliers. Where necessary, we hold the relevant certificates of origin and safety data sheets. The REACH registrations for the ingredients in our products have already been completed by our suppliers.

Our products do not contain any substances of very high concern (SVHC) regulated under REACH, as defined by the candidate list of the European Chemicals Agency (ECHA), with a content of 0.1 \% by weight. They are also not subject to any authorisation requirement associated with a substance listed in Annex XIV.

In addition, our materials are compliant with the restriction list according to Annex XVII of the REACH Regulation.

With regard to the REACH regulation of nickel (entry 27 of Annex XVII), we would like to point out that some of our alloys contain nickel. If you have any questions about the nickel concentration of individual materials, please contact us.
